

IRONHACK FINAL PROJECT

CIVIC TECH WHO'S WHO

2023 DAFT0410 - TATIANA DE FERAUDY

TODAY'S PRESENTATION

- ▶ The 'business' case
- ▶ Project objectives, planning and tasks
- ▶ Data collection & structure
- ▶ Data cleaning
- ▶ ERD
- ▶ Insights
- ▶ Modeling
- ▶ Takeaways and next steps

PROJECT

A PHD PROJECT

- ▶ Who built the civic tech public problem and how ?
- ▶ Qualitative methods and collection of 'grey' literature

AN IRONHACK PROJECT

- ▶ Quantitative/ 'big data' approach
- ▶ A replicable framework for data collection and analysis

PROJECT PLANNING

CIVIC TECH WHO'S WHO

The image shows a Trello board titled "Final_project_Kanban". The board is organized into several columns:

- Data collection:** Contains cards for "Online data" (with a photo of a person writing) and "Combine with PhD data" (with a photo of a person writing).
- Data cleaning:** Contains cards for "Database construction" (with a photo of a robotic vacuum cleaner on a carpet) and "Exploratory data analysis" (with a photo of a complex network graph).
- Analysis & Presentation:** Contains cards for "Data visualisation" (with a photo of a dashboard showing user statistics) and "Data analysis and modeling" (with a photo of a 3D cube network diagram).
- Stuff to remember:** Contains a card with the text "Personal data - pseudonymize" and a "+ Add a card" button.
- Presentation:** Contains cards for "Slides and github repo" (with a photo of a person singing into a microphone) and "Important : improve scraper to get previous experience" (with a "+ Add a card" button).
- Done:** Contains cards for "Done" (with a count of 1), "Make the linkedin scraper work to produce json files of profiles", "Write code to make a dataframe from json files scraped from linkedin", and a "+ Add a card" button.

At the top of the board, there are various navigation and power-up buttons: "Workspace visible", "Board", "Power-Ups", "Automation", "Filter", "Share", and "Done".

MODELING & PREDICTION

RECREATING THE DATASET OF PEOPLE (2 ITERATIONS)

- ▶ Concatenating different collected datasets of linkedIn profiles
- ▶ Basic cleaning : dropping duplicates, dropping columns with too many missing values ($>\text{len}(\text{dataset})/2$)

NLP & RANDOM FOREST CLASSIFIER

- ▶ NLP because : text
- ▶ RFC because : classifier, tree structure, Howard Becker
- ▶ Choosing a target for prediction : industries, companies, or civic tech 1/0 ?

KEY FINDINGS

- ▶ It works on raw data - and even better with manual resampling !
- ▶ RFC quickly overfits
- ▶ Size doesn't matter (much)
- ▶ Forest depth and size do
- ▶ Gridsearch isn't always the best choice
- ▶ Ngrams offer different results
- ▶ Stop words, stemmers and TF-IDF need improvement !

	Accuracy_Score	Number_words
RFC_raw_CVec	0.571429	20683.0
RFC_raw-balanced_CVec	0.666667	20683.0
RFC_raw-balanced_CVec_BP	0.571429	20683.0
RFC_raw-balanced_CVec_BmP	0.714286	20683.0
RFC_CVec_E50_D17_nG	0.619048	90796.0
RFC_CVec_balanced_E50_D17_nG	0.619048	90796.0

RFC_TFIDF_E50_D17	0.428571	20683.0

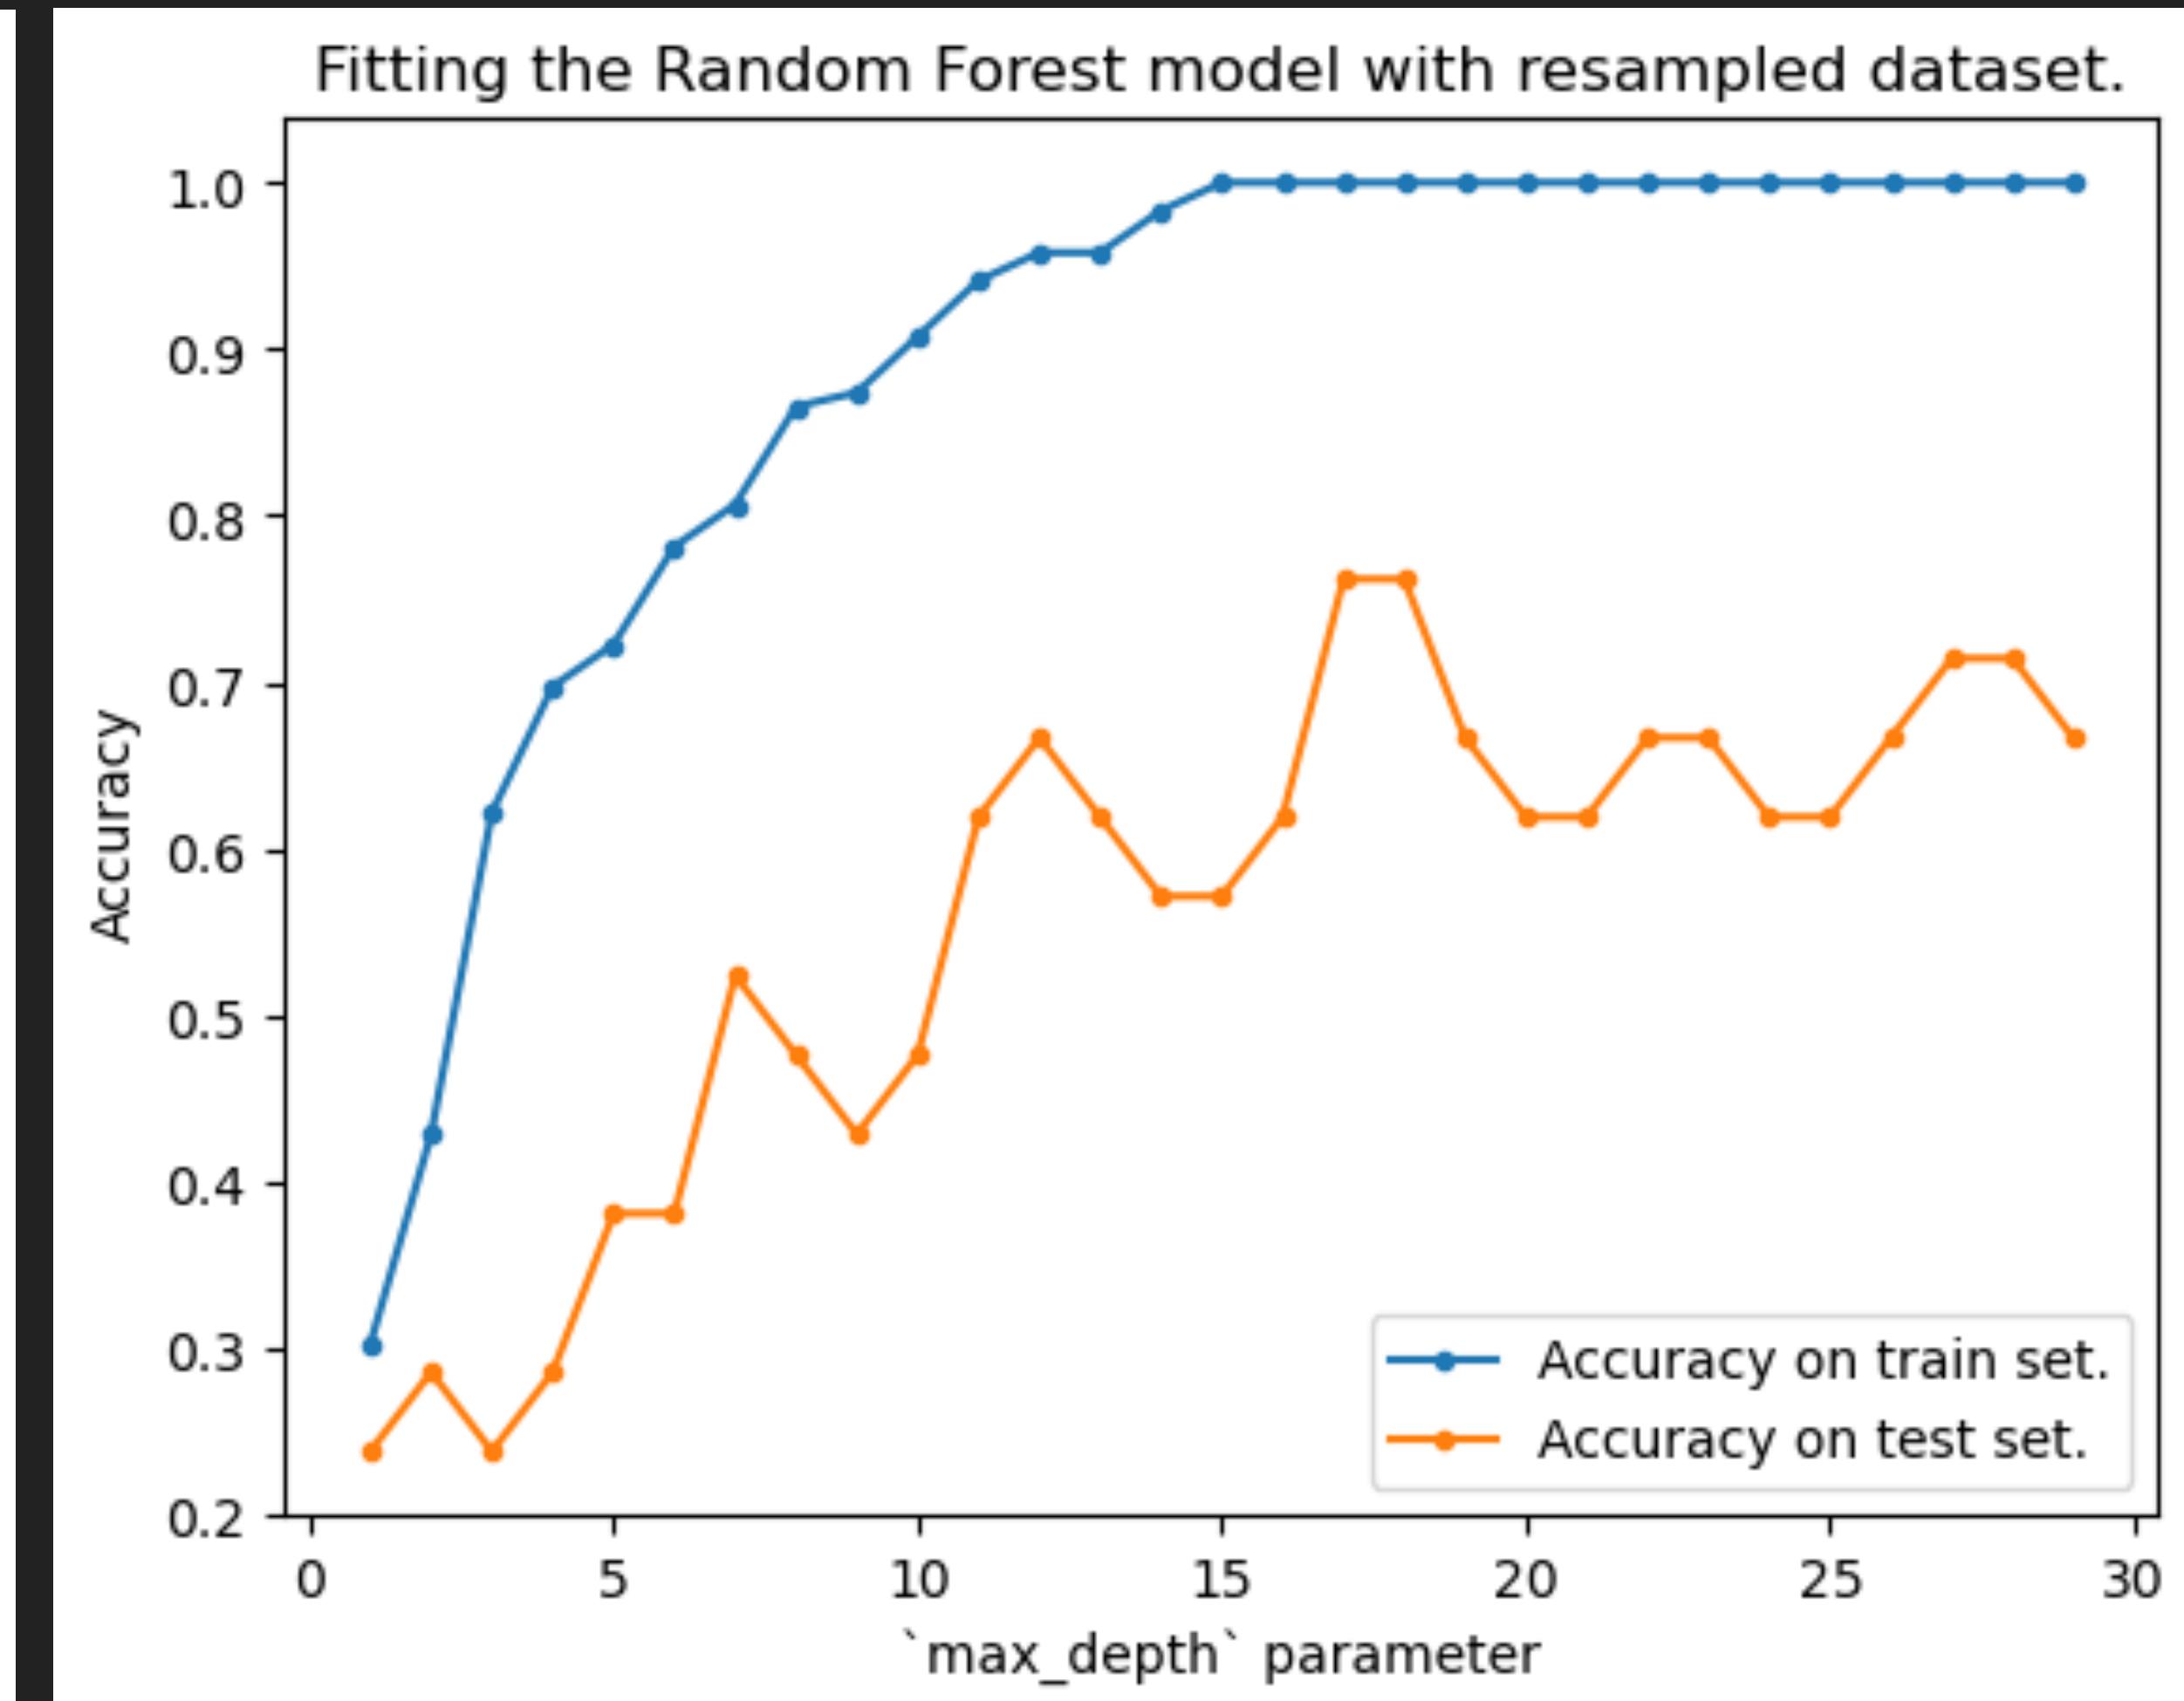

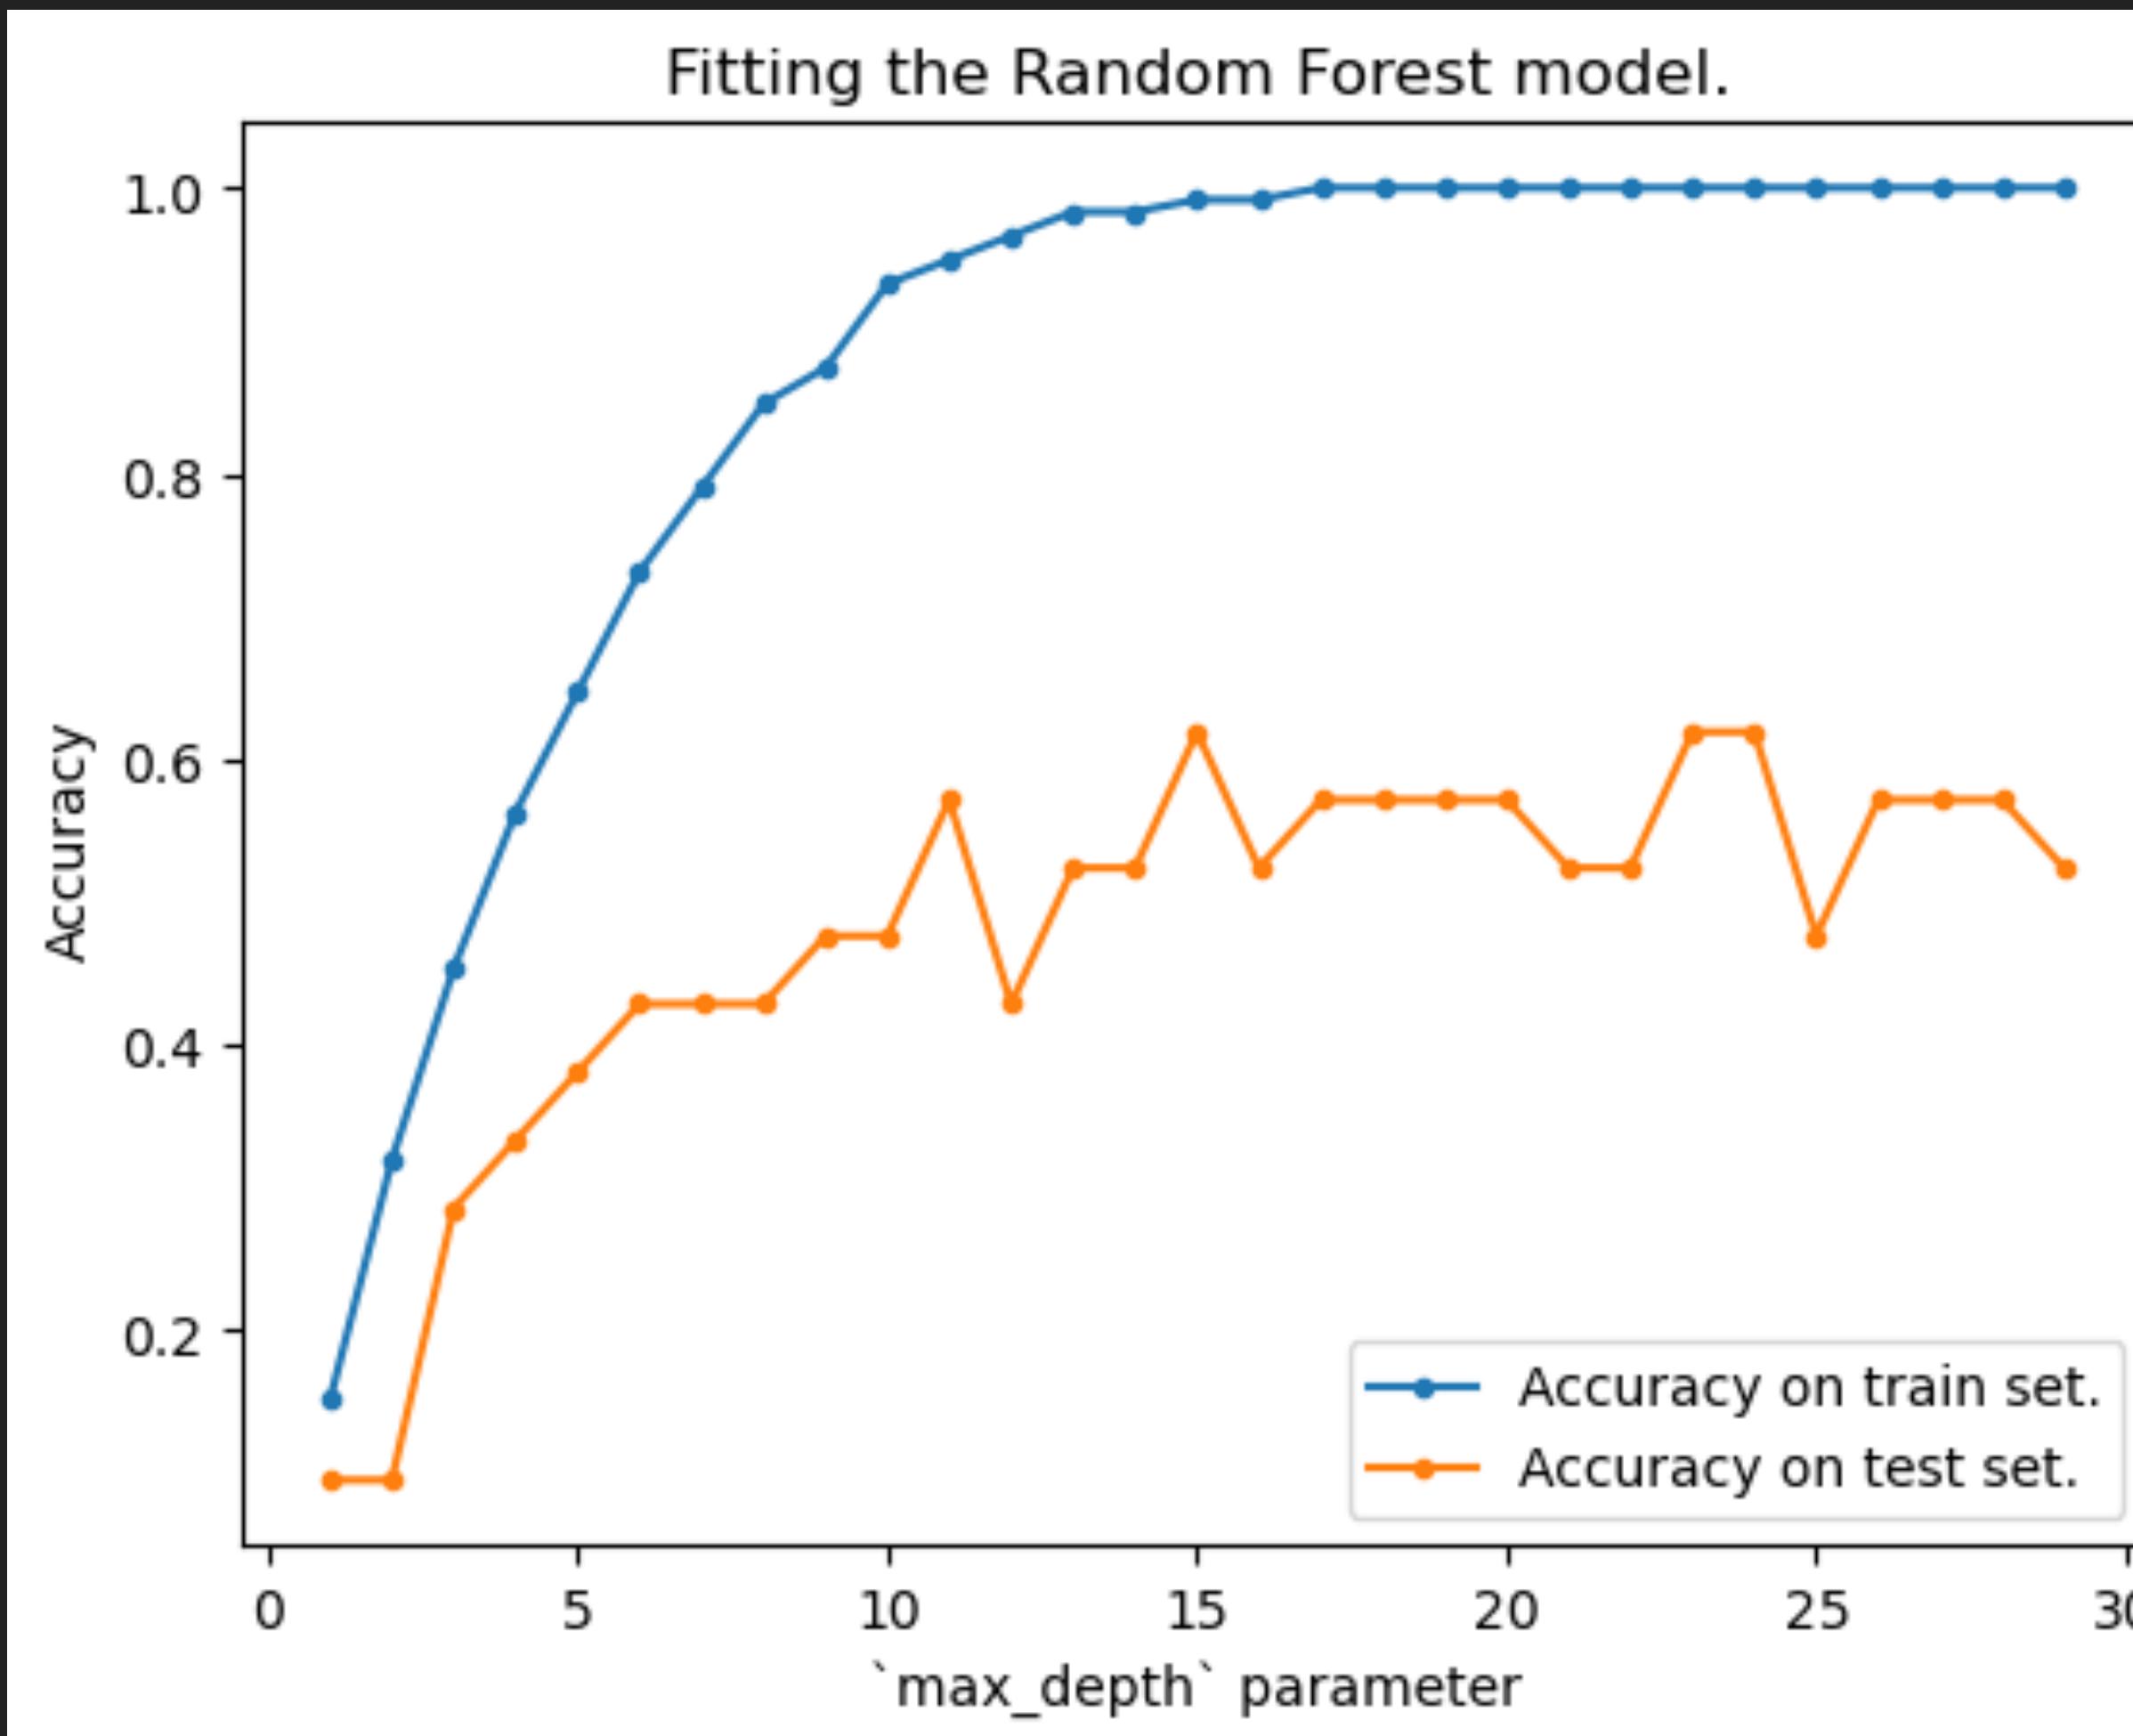

MORE DETAIL ?

- ▶ Our first try returned an accuracy of 0.57 (for 44 categories)

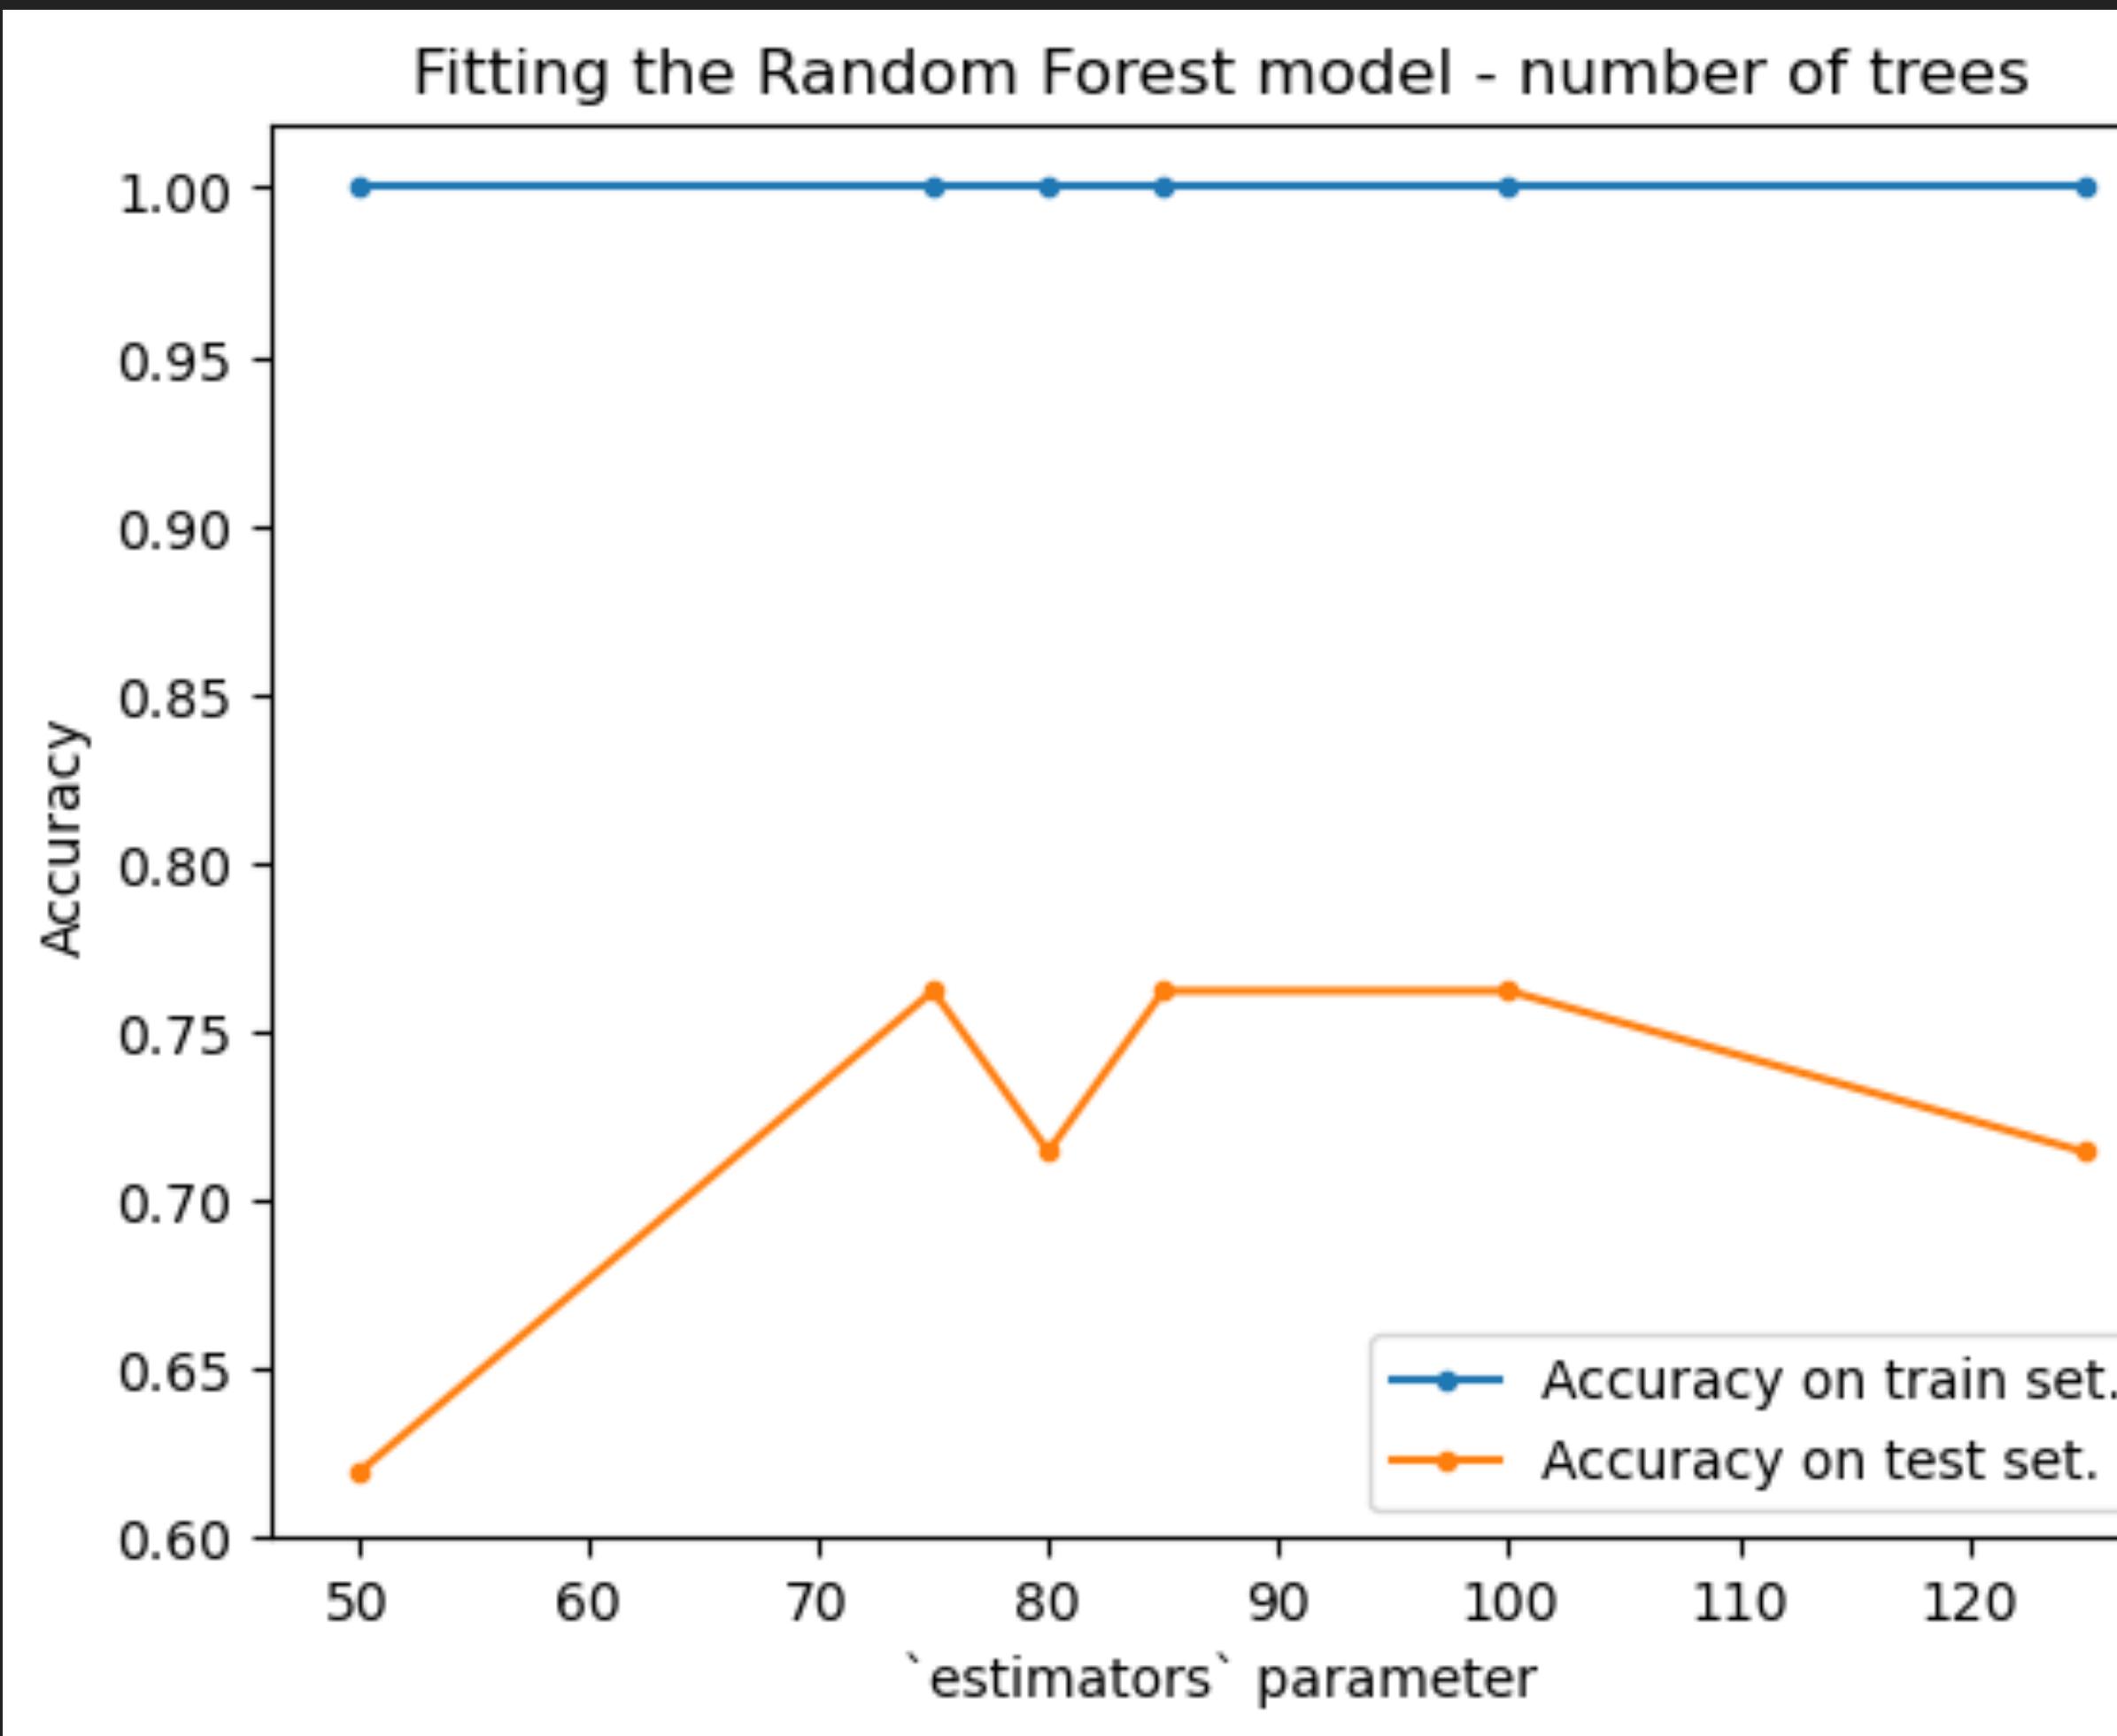

model1_confusion_matrix

	Predicted industry	Civic Social Organization	Computer Software	Government Administration	Information Technology and Services	Management Consulting	Performing Arts
Actual Industry	\						
Civic Social Organization		4					
Computer Software			2				
Government Administration				1			
Information Technology and Services				1	3		
Management Consulting						2	
Market Research				1			
Online Media				1			
Research				1			
Architecture Planning					1		
Higher Education						1	
Information Services						1	
Investment Banking						1	
Leisure Travel Tourism							1

- ▶ Overfitting and manual parameter selection (max depth)

► Overfitting and parameter selection (number of trees)

```
1 # If we fit it on the resampled dataset
2 # it gets a far better score (0.88)
3 # with a recommended max depth of 18 and 125 estimators.
4 # We can try pushing it farther
5 # It gets a score of 0.91 with a max_depth of 20 and 175 estimators
6 # although this basically means more than 1 tree per person :)
7
8 grid_search_cv = GridSearchCV(model_rf, {
9     'n_estimators': [110, 125, 150, 175],
10    'max_depth': [17, 18, 19, 20, 21]
11 },
12   cv=3, scoring='accuracy')
13 grid_search_cv.fit(X_train_rs, y_train_resampled)
14 print(grid_search_cv.best_score_)
15 print(grid_search_cv.best_params_)

✓ 1m 1.9s
```

```
0.9159621936476535
{'max_depth': 20, 'n_estimators': 175}
```

WILL AI REPLACE SOCIAL SCIENTISTS ?

CIVIC TECH WHO'S WHO

- ▶ Probably not 😅
- ▶ When adding complexity (languages, projects, publications (i.e. columns with missing data), the model has trouble following - we get to .22 with a lot of tweaking and a lot of trees (400+)...
- ▶ Still better than 1/47

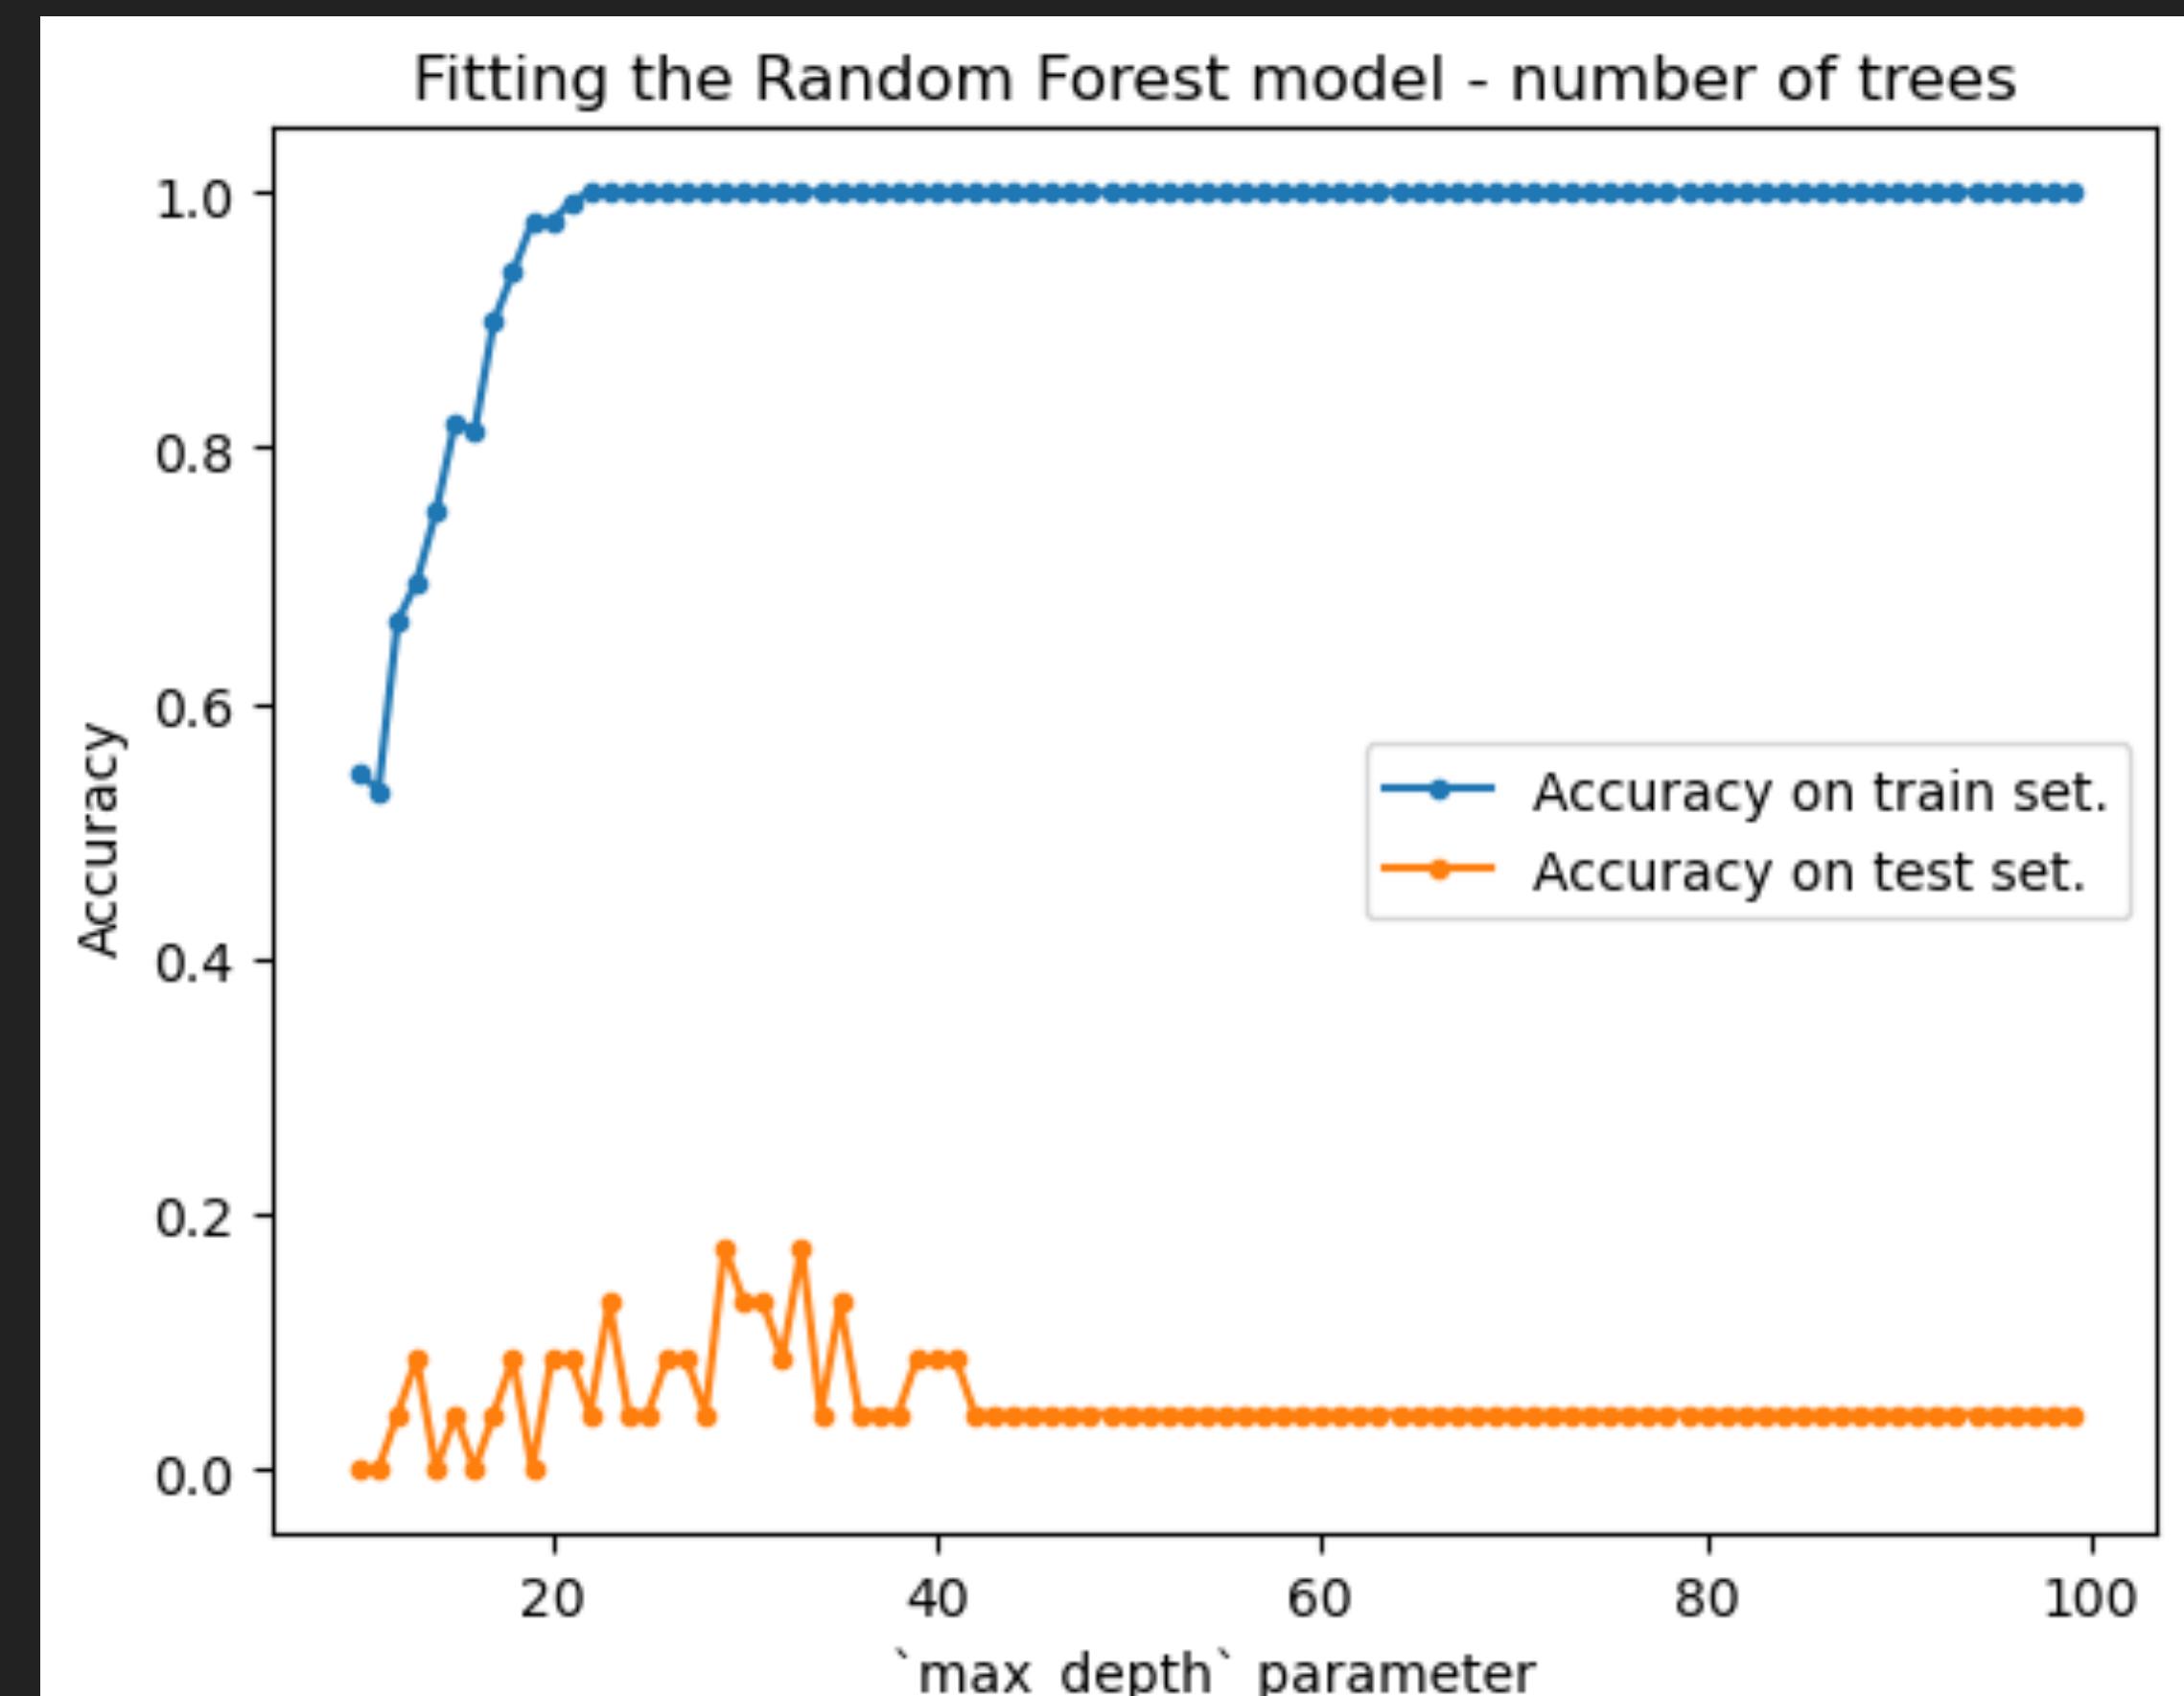

```
1 model_rf = RandomForestClassifier(random_state=42, class_weight='balanced_subsample')
2 model_rf.fit(X_train, Y_train)
✓ 0.1s
```

```
RandomForestClassifier
RandomForestClassifier(class_weight='balanced_subsample', random_state=42)
```

```
1 y_pred = model_rf.predict(X_test)
✓ 0.0s
```

```
1 accuracy_score(Y_test, y_pred)
2 # IS NOT GREAT :(
✓ 0.0s
```

0.17391304347826086

COMING SOON

FUTURE IMPROVEMENTS IN MODELING

- ▶ A 'next company' recommender based on nearest neighbors
- ▶ Using a PCA to make clusters of people
or MCA, actually, for correlated features
- ▶ Use PCA to make clusters of companies
- ▶ Change the y to
 - ▶ civic tech yes/no
 - ▶ or to the clusters
